```
/**
 * 🎨 Art Gallery Navigator — Student Template
 *
 * Task Description (2–3 lines):
 * Create a console-based "Art Gallery" app that displays artworks with their titles and artists.
 * Allow users to navigate through artworks (Next / Previous) using functions.
 *
 * Instructions:
 * 1) Create a data class `Artwork` with three properties: title (String), artist (String), and year (Int).
 * 2) Create a function `displayArtwork(art: Artwork)` that prints its details in a formatted way.
 * 3) Create a function `nextArtwork(currentIndex: Int, total: Int): Int` that returns the next index (wrap to 0 if at end).
 * 4) Create a function `previousArtwork(currentIndex: Int, total: Int): Int` that returns the previous index (wrap to last if at start).
 * 5) In `main()`, create a list of 3–4 artworks.
 *   - Start with the first one.
 *   - Simulate pressing "Next" and "Previous" several times by calling the above functions.
 *   - Print the artwork details after each navigation.
 *
 * 💡 Hints:
 * - Use modular arithmetic or if/else for looping navigation.
 * - Use string templates for pretty output.
 * - Try testing navigation logic manually by checking printed results.
 *
 * 📜 Sample Output:
 *
```

```
* Viewing: Starry Night (Vincent van Gogh, 1889)
* -> Next Artwork
* Viewing: Mona Lisa (Leonardo da Vinci, 1503)
* -> Next Artwork
* Viewing: The Persistence of Memory (Salvador Dalí, 1931)
* -> Next Artwork
* Viewing: Starry Night (Vincent van Gogh, 1889)
* -> Previous Artwork
* Viewing: The Persistence of Memory (Salvador Dalí, 1931)
*
* TODOs:
* // TODO: Create the Artwork data class
* // TODO: Implement displayArtwork(art: Artwork)
* // TODO: Implement nextArtwork() and previousArtwork()
* // TODO: Implement main() with a list of artworks and test navigation

// TODO: Implement previousArtwork(currentIndex: Int, total: Int): Int

// TODO: Implement main() and simulate navigation through artworks
```

```
// Define data class
data class Artwork(val title: String, val artist: String, val year: Int)

// Function to display artwork details
fun displayArtwork(art: Artwork) {
   println("Viewing: ${art.title} (${art.artist}, ${art.year})")
}

// Function to get next artwork index
fun nextArtwork(currentIndex: Int, total: Int): Int {
   return (currentIndex + 1) % total
}

// Function to get previous artwork index
fun previousArtwork(currentIndex: Int, total: Int): Int {
   return if (currentIndex - 1 < 0) {
      total - 1
   } else {
      currentIndex - 1
   }
}

// Main function
fun main() {

   val artworks = listOf(
      Artwork("Starry Night", "Vincent van Gogh", 1889),
      Artwork("Mona Lisa", "Leonardo da Vinci", 1503),
```

```
    Artwork("The Persistence of Memory", "Salvador Dali", 1931),
    Artwork("The Scream", "Edvard Munch", 1893)
  )

  var currentIndex = 0

  displayArtwork(artworks[currentIndex])

  println("Next Artwork")
  currentIndex = nextArtwork(currentIndex, artworks.size)
  displayArtwork(artworks[currentIndex])

  println("Next Artwork")
  currentIndex = nextArtwork(currentIndex, artworks.size)
  displayArtwork(artworks[currentIndex])

  println("Next Artwork")
  currentIndex = nextArtwork(currentIndex, artworks.size)
  displayArtwork(artworks[currentIndex])

  println("Previous Artwork")
  currentIndex = previousArtwork(currentIndex, artworks.size)
  displayArtwork(artworks[currentIndex])
}
```
