AADK TASK 1

Text Composables Understanding & Exploration

MindMatrix

1. Definition: What is a @Composable function?

A @Composable function is a special function in Jetpack Compose that is used to build UI elements. It tells Android that this function describes part of the screen. Instead of using XML layouts, we create UI directly using these composable functions in Kotlin.

2. Three Key Text Composables

1) Text

What it does in UI layout:
Text composable is used to display text on the screen. It can show titles, paragraphs, labels, or any written content.

Example use-case:
Displaying a welcome message like “Hello Student” at the top of the screen.

2) Column

What it does in UI layout:
Column arranges UI elements vertically (one below another).

Example use-case:
Placing a title, subtitle, and paragraph in a vertical format from top to bottom.

3) Row

What it does in UI layout:
Row arranges UI elements horizontally (side-by-side).

Example use-case:
Placing two text buttons like “Login” and “Register” next to each other.

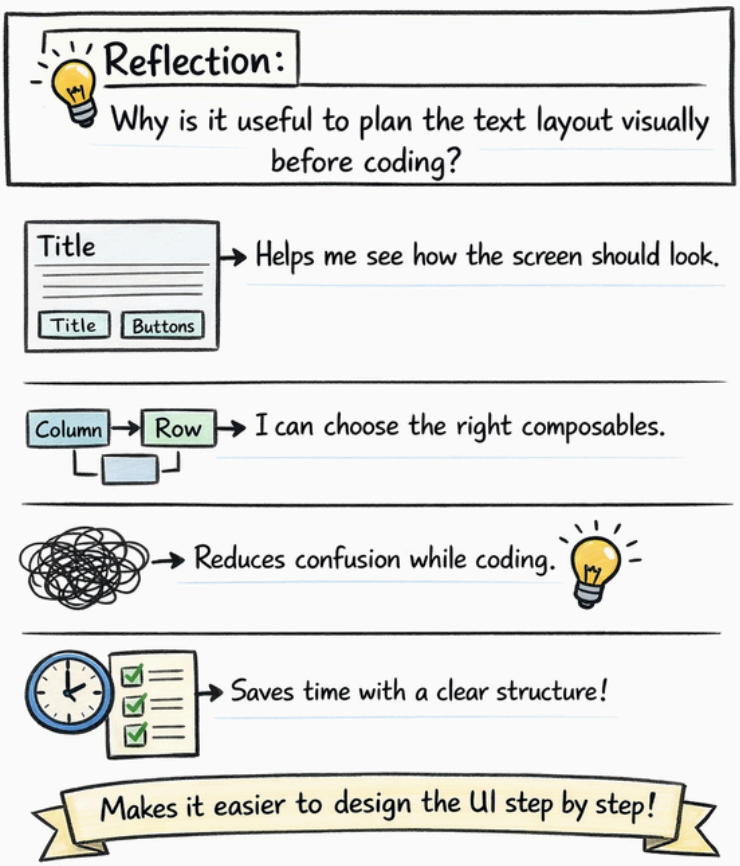
3. How Column and Row Affect Text on Screen

Column makes text elements appear one below the other in a vertical structure. So if we put three Text composables inside a Column, they will be arranged from top to bottom.

Row makes text elements appear side-by-side horizontally. So if we put two Text composables inside a Row, they will appear next to each other in the same line.

This helps us control how the text looks and how the layout is organized on the screen.

4. Wireframe Design (Simple Layout Plan)



Composables Used:

- Main container → Column
- Title → Text
- Subtitle → Text
- Paragraph → Text
- Buttons container → Row
- Buttons → Text (Clickable) or TextButton

5. Reflection (Why planning visually is important)

Planning the text layout visually before coding is very useful because it helps us understand how the screen should look. It reduces confusion while writing code and saves time. When we draw a wireframe, we can clearly see where to use Column or Row. It also helps us focus on design structure first instead of directly jumping into coding. This makes our UI cleaner and more organized.
