AADK TASK 3

Planning a Simple Layout with Text + Image

MindMatrix

1. App Concept: Birthday Greeting Card App

Screen Purpose
The purpose of this screen is to show a beautiful birthday greeting card with an image at the top and a heartfelt message below it. It should look simple, attractive, and well arranged.

2. Wireframe

Composables I Would Use

- Column → Main vertical layout (to arrange everything from top to bottom)
- Image → To display birthday cake image (from drawable resource)
- Text → For title and message
- Button → For sending wishes

Spacing / Padding Plan

- 24 dp top padding for the screen
- 16 dp space between Image and Title
- 8 dp space between Title and Body text
- 24 dp space between Body text and Button
- 16 dp horizontal padding on left and right sides

This spacing will make the layout look clean and not crowded.

3. Resource Plan

Image Plan

Image Purpose	File Name	Folder	File Size
Birthday cake image	birthday_cake.png	drawable-nodpi	Medium

Reason:

- Using drawable-nodpi so Android doesn't scale it automatically.
- Image will be optimized before adding (compressed PNG).
- Not too large in MB to avoid performance issues.

Text Plan

Text Type	Font Size	Color
Title	24 sp	primaryTextColor
Body Text	16 sp	secondaryTextColor
Button Text	14–16 sp	white

Title will be bold to make it stand out.
Body text will be normal weight for readability.

4. Reflection

Planning composables and resources before coding helps avoid confusion later. If we decide layout structure early (Column, Image, Text, Button), coding becomes easier and faster. Choosing correct image size and spacing prevents alignment issues. It also reduces rework because we already know how the UI should look. This design-first approach improves overall UI quality and saves development time.
