AADK TASK 3

Usability Review & Accessibility for Interactive Buttons

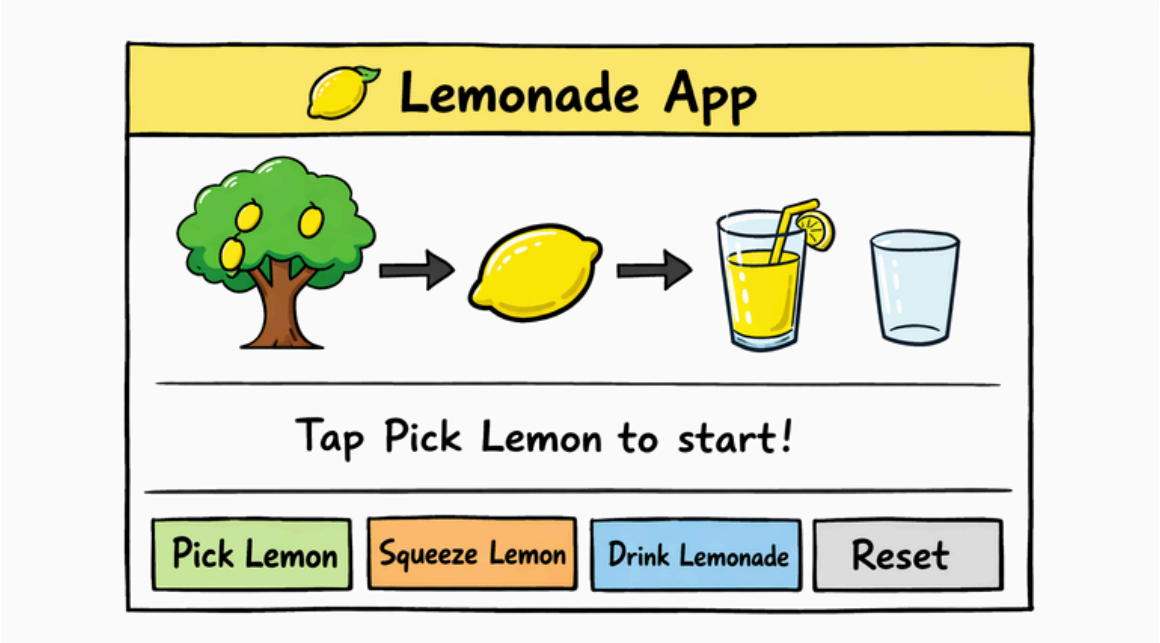
MindMatrix

Example App Reviewed: Lemonade App (from Task 2)

I am reviewing my Lemonade App multi-button screen which contains: Pick Lemon, Squeeze Lemon, Drink Lemonade, and Reset buttons.

1. Screen Description

Screen Layout Sketch



The screen contains:

- Image area (lemon tree / lemon / lemonade / empty glass)
- Status text (instruction message)
- Four horizontally aligned buttons at the bottom

Buttons:

- [Pick Lemon]
- [Squeeze Lemon]
- [Drink Lemonade]
- [Reset]

2. Usability & Accessibility Checklist Review

Button Size (48dp Minimum Height)

- In my initial design, buttons were visually equal but I did not explicitly ensure 48dp minimum height.
- On small screens, buttons may become cramped.

Text Legibility & Contrast

- Button text is clear.
- However, light green and yellow backgrounds may have low contrast with white text.

Logical Grouping & Labels

- Buttons are clearly labelled.
- However, all four buttons are active at the same time, which may confuse users (e.g., “Drink Lemonade” visible before squeezing).

Feedback on Click

- In Compose, Button provides ripple effect by default.
- But my design does not visually disable buttons that are not valid in the current state.

Accessibility

- Image area may not have proper contentDescription.
- Buttons may need clearer accessibility labels.
- Colour alone is used to indicate meaning.

Small Device Adaptation

- Buttons arranged in one row may not fit smaller screens.
- Layout may overflow in landscape mode.

3. Review Table

Issue	Description	Proposed Fix	Priority
Button Size	Buttons may be smaller than 48dp	Explicitly set Modifier.height(48.dp)	High
Poor State Clarity	All buttons enabled at once may confuse	Disable buttons not relevant to current	High
Low Colour Contrast	Light button backgrounds may	Use darker accessible colours and test	Medium
Missing contentDescriptio	Images may not be readable by screen	Add meaningful contentDescription for	High
Layout Overflow	Buttons in single row may not adapt on	Use Column or FlowRow for	Medium

Reflection

Usability and accessibility are essential because buttons are the main way users interact with an app. If buttons are too small, poorly labelled, or lack feedback, users may become confused or frustrated. Accessibility ensures that people using screen readers or with visual impairments can still use the app effectively. Designing with usability and accessibility in mind improves overall user experience and makes the app inclusive for everyone.
